### Abstract

The Alberta Transplant Institute designed a strategic research planning initiative to address the unique research needs of organ and tissue donation and transplantation in Alberta. Bringing together the broad Alberta donation and transplantation ecosystem, this initiative created an effective mechanism to link a region's research expertise with system-identified and patient, family, and donor-identified challenges to create a unified, prioritized body of key research needs. Patient, family, and donor partners were integrated into every stage of this initiative. We applied the Nominal Group Technique methodology to create consensus priorities, divided into five topic areas spanning the full spectrum of organ donation and transplantation science, policy, and practice. The consensus-building process involved a survey, 10 virtual working group sessions, and a hybrid community consultation event. Fifteen research priorities emerged and were consolidated into a strategic research roadmap for the Alberta Transplant Institute. This work aims to ensure that the Institute's research activities remain focused on addressing the most pressing challenges. The process and findings are a valuable resource for researchers, policymakers, and healthcare practitioners in Alberta and beyond who are committed to a consensus-based approach to producing new knowledge, practices, and policies.
